

LRS APIs for Developers

Run operations better and smarter. Connect LRS tools and services with any third party solution, and streamline notifications, alerts, and data.

LRS' open platforms make it possible to integrate LRS paging, tracking, or service data with any other solution. Eliminate the need for multiple, disparate software solutions, or collect LRS paging or tracking service data and feed it directly into your business intelligence tool.

LRS' three APIs provide endless options for restaurant, retail, hotel, logistics, and other solution providers.

LRS Paging API

Notify guests or staff from any software application. Integrate LRS' Connect Transmitter to start, page, message, cancel, and end paging sessions. Uses include:

APPLICATION	SOLUTION
Restaurant Reservation and Waitlist Applications	Offer customers the option to be paged from an LRS pager by entering and notifying guests within the reservation or wait list application.
Restaurant and Retail Point of Sale Applications	When taking a customer's order, add a pager number to manually or automatically notify them when their order is available for pick-up.
Healthcare or Logistics Check-in Systems	Provide customers a pager when checking in and alert when appointment or goods are ready.
Entry/Exit Monitoring Systems	Automatically set alerts for one or many staffers when customers or co-workers use an entrance.

LRS TRACKING API

Locate guests at a specific location to quickly deliver goods or services. Integrate LRS' Tracker solution to monitor guest locations, deliver, or page customers. Uses include:

APPLICATION	SOLUTION
Restaurant Point of Sale Applications	When taking a customer's order, add a tracker number to monitor their location, or page customers when orders are ready for pick-up.
Restaurant Kitchen Display Applications	Feed guest location data into kitchen systems to locate customers for table-side delivery on screen, or within kitchen receipt print-outs.

LRS CLOUD DATA API

Ingest LRS service flow and time data via the LRS Connect Cloud into a business intelligence tool to further analyze customer behaviors. Combine with sales and operational data to better understand workflow, space usage, and speed of service. Uses include:

APPLICATION	SOLUTION
Business Analytics Tool	Using the LRS Connect Cloud API, pull paging and/or tracking data into a tool of choice to further analyze important service metrics.
Data Repositories	Feed LRS data into your own data lake for archiving and analyses.

HOW IT WORKS

- 1 Review LRS' API documentation at lrsus.com/developer.
- 2 Order an LRS hardware developer kit (paging or tracking).
- 3 Write to LRS' API of choice.
- 4 Consult LRS sales engineering if needed.

FEATURES

- Open API documentation
- Free API use with purchase of LRS hardware
- Developer kits available for purchase
- Sales engineering support available
